ANALYSIS OF FAUNAL REMAINS

VERTEBRATE FAUNA FROM NINA PLANTATION (16PC62)

A total of 7,089 bone fragments (6,808 when adjusted for fitted and glued bones) weighing 9,750 grams was analyzed from excavations at Nina Plantation (16PC62) in central Louisiana. Table 1 provides a list of the animal taxa identified for the site.

The faunal material was in a good state of preservation and was not heavily mineralized, thus not affecting the use of bone weight to estimate biomass (meat weight). Some of the bones had small amounts of rust adhering to them, but this did not seem to greatly affect the weight of the bone fragments.

The site has two main areas, that associated with the Main House and that associated with Structures 1 and 2 to the south of the Main House. There are also two main periods of occupation at the site, separated stratigraphically by a layer of silt deposited during the flood of 1851.

The plantation was owned during the first half of the nineteenth century by the French Jarreau family (c. 1820-1851) (called the Early Period here) and during the second half of the century by several Anglo-American families (1851-1890s) (called the Late Period here). Faunal material associated with the Main House comes from midden areas which would have been underneath or outside the house, which sat on piers.

Structures 1 and 2 seem to have been occupied by African American slaves and, later, (post-bellum) servants/tenants.

Faunal material associated with these structures comes from the interiors of each as well as exterior midden deposits associated with both. Structure 1 appears to have been a residence that also served as a kitchen for the Main House, and its function as a kitchen seems to have increased in the second half of the century. Structure 1 had a substantial fireplace, first of wood-and-clay and then of brick, while Structure 2 had a hearth dug into the dirt floor. Although there were fireplaces in the Main House, they do not seem to have been used for substantial amounts of food preparation, although an increase in the amount of bone found around the Main House during the Late Period suggests either more food being eaten there (perhaps by larger families or groups of people) and/or more food preparation being carried out there rather than, or in addition to, that carried out in Structure 1/Kitchen.

Methods

All faunal material from the Early Period deposits was analyzed; these proveniences contained less material than the later ones and it was felt that sampling them would negatively affect the analysis. However, the Late Period contexts contained much more bone than time and money constraints would allow to be analyzed; units from the Late Period were eliminated if they contained very small amounts of bone or if they were contiguous to units that had very large and diverse faunal assemblages. Thus, for the Late Period, the largest possible quantity of faunal material from each of the cultural contexts was analyzed, resulting in half or more of the Late Period fauna being analyzed.

Because of the sampling of Late Period contexts, however, comparisons of absolute counts, bone weights, and meat weights cannot be made directly between Early Period and Late Period deposits. Relative percentages must therefore be used, showing the importance of various species relative to other species within a certain time period and provenience. For example, cattle might have accounted for a certain percentage of the Early Structure 1/Kitchen assemblage that was higher or lower than the percentage of cattle in the Late Structure 1/Kitchen or in the Early south wing/core of the Main House.

In addition, two of the assemblages in Block E were very small (less than 10 bones) and are therefore not reliable indicators of the importance of various species for those particular contexts: the earliest midden around the core of the Main House (Area Sequence 08) and F. 66, the Late Period fireplace in the north wing of the Main House (Area Sequence 16).

All of the material was counted and weighed. Primary data consist of raw fragment counts (the actual number of fragments), adjusted fragment counts (adjusted to account for glued and fitted bones in the same field bag), and weights (to the nearest 0.1 gram). Also noted with the primary data are the numbers of fragments that have been worked, have butchering marks, are burned (black) and calcined (grey, green, blue, or white), and have gnawing marks (by rodents and carnivores).

Secondary data consist of calculations: the Minimum Number of Individuals (MNI) represented for a particular taxon and the biomass

(meat weight) represented by the bone weight for a particular taxon. MNIs are calculated using the criteria of side, size, age, and sex; they are calculated for each cultural provenience (e.g., Early Kitchen/Structure 1 Interior, Late South Wing/Core, Earliest Midden-Core) (Wing and Brown 1979:123-126; Reitz and Scarry 1985:17). Biomass (meat weight) is estimated using the log-log regression formulae of skeletal mass allometry, and is based on bone weight (Wing and Brown 1979:127-129; Reitz and Scarry 1985:18-19, 67; Reitz et al. 1987). It predicts the amount of meat that would have been adhering to the actual bones recovered and is therefore a relatively conservative estimate of the amount of meat contributed by each species or taxon.

Of course, there were more individuals and more meat actually consumed during the site's occupation than the faunal assemblage indicates. However, when adequate samples are available (and this is generally the case for the Nina Plantation material) the MNI and biomass calculations do provide some idea of the relative importance of various species or groups of species in the diet(s) of the people who lived at a site.

Several taxa are probably commensal, including unidentified small rodents, unidentified frogs/toads, and small rats/mice. Eastern woodrat and horse might represent food remains; it is possible but less likely that a domestic cat bone does (found in the Late Period interior of Structure 2).

Overall Summary

Table 2 summarizes the primary data for each cultural provenience. The greatest percentage of burned/calcined bone is found in the interiors of Structures 1 and 2, where fireplaces also were located. The highest percentage (21.8%) is from the interior of Structure 2 in the Early Period; the next highest (19.9%) is from the Early Structure 1/Kitchen interior; and the third highest (14.5%) is from the Late Structure 2 interior. All other contexts have much smaller quantities (some have none) of burned/calcined bone.

The greatest percentage of gnawed bone (both carnivore- and rodent-gnawed, although rodent gnawing is more prevalent) is found in deposits associated with the Late Period. The highest percentages are from the south wing and core of the Main House (14.8%). Of the bone from the north wing and core of the house, 9.3%

was gnawed, while the Late Period interiors of Structure 2 (12.9%) and Structure 1/Kitchen (8.9%) had the other higher percentages. This suggests an increase in the presence of rodents (and possibly of carnivores) through time.

Only four fragments of bone showed signs of being worked, and they occur in the Late Period deposits in both the Main House and Structure 1-2 areas of the site. Two of these appear to be handle fragments for implements of some kind; the function of the other two cannot be determined.

Domestic versus Wild Species

Setting aside the earliest deposits around the core of the Main House (in Blocks D and E) due

to very small quantities of material in each, most of which could not be clearly identified as domestic or wild, domestic species contributed more of the total biomass (usually much more) than did wild species throughout the site (Table 3).

White-tail deer is present only in the Early Structure 1/Kitchen interior, Early exterior deposits around Structures 1 and 2, and in the Late Structure 1/Kitchen deposits; that is, deer occurs only in Block C, in the area associated with Structures 1 and 2. It is, of course, possible that deer might be present in the unanalyzed material from the Late Period in Blocks D and E, but it is believed that the material analyzed from those Blocks is as representative as is possible.

Wild mammals contributed the most biomass in the Early Structure 1/Kitchen interior (8.4%). Wild birds contributed the most (2.0%) to the Late Structure 1/Kitchen interior, although a similar percentage (1.9%) was contributed by wild birds in the Early Period core (second [red] deposits) of the Main House.

Reptiles and amphibians (mostly turtles) contributed the greatest percentage (10.7%) to the Early Period core (second [red] deposits) of the Main House in Block E, with the next highest percentage (9.0%) being in the Early Period core (earliest deposits) of the Main House in Block D.

Fish contributed the greatest percentage to the diet in the Early Period deposits outside Structures 1 and 2 (7.1%), although fish contributed similar percentages to the Early Period interiors of Structures 1 (5.8%) and 2 (6.1%) and the Late Period Structure 1/Kitchen interior (5.3%). Fish contributed 4.9% of the biomass in the Early Period core (second [red] deposits) of the Main House in Block E.

When these categories are combined into domestic taxa, wild taxa, and indeterminate do-

mestic/wild taxa, several trends are apparent (Table 4).

Those proveniences with larger samples and in which at least 50% of the bone could be identified as domestic or wild are the most reliable from which to draw conclusions. This includes all of the deposits associated with Structures 1 and 2; the Early Period second midden and undifferentiated deposits around the south wing and core of the Main House; and the Late Period deposits associated with the south wing, north wing, and core of the Main House.

The contexts with the greatest dependence on domestic species are the Late Period north wing and core of the Main House (73.0%) and the Early Period undifferentiated deposits associated with the south wing and core of the Main House (71.6%).

The greatest use of wild species (in a context with a sufficient sample) is found in the Early Period interior of Structure 1/Kitchen (15.6%) and the Early Period exterior around Structures 1 and 2 (14.6%).

* Sample sizes are very small and/or > 50% of the bone was indeterminate domestic/wild.

The least use of wild species is found in the Late Period north wing and core of the Main House (1.6%), although the deposits associated with the Late Period south wing and core had a similar small percentage of wild species (1.8%).

The Early Period Structure 1/Kitchen and Structure 2 deposits exhibit the greatest use of wild species. Through time this use of wild species decreased, although it did so least of all in the interior of Structure 1/Kitchen. It is the Structure 2 interior and general exterior deposits around Structures 1 and 2 that reflect a sharp drop in the use of wild species in the Late Period.

The importance of domestic species remains relatively stable in the Structure 1/Kitchen interior and in the general exterior deposits around it and Structure 2; domestic species increase in the Structure 2 interior deposits, where there is a corresponding sharp drop in the use of wild species. Even though the percentage of domestic species remains relatively stable for the Structure 1/Kitchen interior through time, there is a slight decrease in the use of wild species.

Much greater disparity between domestic and wild species is seen in the Early and Late deposits associated with the south wing and core of the Main House. Even though the Late Period deposits of the south wing and core, Structure 1 interior, and Structure 2 interior all have a similar percentage of domestic taxa, the south wing and core deposits reveal much less use of wild species than Structures 1 and 2. A high dependence on

domestic species is evident in the Late Period deposits associated with the north wing and core of the Main House, with the least use of wild species there of any of the contexts.

Thus, moving from south to north across the site, in both periods, there is a general increase in the importance of domestic species and a sharp decrease in the importance of wild species. A decrease in the importance of wild species from the Early to the Late Period is seen also in the Structure 1-2 area deposits.

When the various proveniences for each time period are combined, there are other similarities and differences in the use of domestic and wild species that appear across the site (Table 5).

The Early Period deposit to the north of the core of the Main House has a very small sample ($n=3$), with 80.9% of the bones indeterminate as wild or domestic. The small amount of material suggests that, during the Early Period, little food refuse was disposed of on the north side of the Main House.

It does seem food was disposed of on the south side of the core and outside the south wing of the Main House during the Early Period. The Early Period south wing and core deposits are very similar to those from the Structure 1 and 2 area in terms of importance of domestic species, although domestic species were slightly more important in the Main House deposits. Wild species were significantly more important in the Structure 1-2 area, however.

Among the Late Period deposits, again, the south wing area of the Main House is very similar to the Structure 1-2 area deposits in terms of the importance of domestic species; the north wing area of the Main House reveals a much greater dependence on domestic species. However, both the south and north wings of the Main House reveal a similar low dependence on wild species, compared to the greater dependence on wild species at the Structure 1-2 area.

It is possible that the lower percentage of domestic species in the south wing area is related to the higher percentage of indeterminate bones there (46.1%) than is true for the north wing area (25.8% indeterminate). The lesser proportion of domestic species in the south wing area also might reflect refuse from secondary food preparation, with the north wing refuse reflecting disposal of food remains after meals. It also could be the case that different people ate in the south and north wings of the Main House during the Late Period, with the group in the north wing using domestic species to a greater degree.

If one looks at change through time in the use of wild and domestic species, in the Structure 1-2 area, there is a slight increase in the proportion of domestic species and a marked decrease in the importance of wild species through time. In the south wing and core area of the Main House, there is a very slight decrease in the use of domestic species, and a larger decrease in the use of wild species. In the north wing and core area, there is a dramatic increase in the amount of bone refuse, suggesting food refuse was not habitually deposited in that area until after the north wing was built. Although the Early Period samples are small in this area, there is certainly a large increase in domestic species through time.

Animal Classes and Change Through Time

In terms of biomass, mammals are the most important animal class in both periods and in both areas of the site (Table 6; detailed in Tables 7-9). Among the Early Period contexts, mammals contributed 82.2% (north part of the core of the Main House), 85.4% (south wing and core of the Main House), and 89.4% (Structure 1-2 area). In all of these contexts in the Late Period, this percentage increased markedly. In the Late Period Main House deposits, close to 97.0% of the biomass is from mammals, compared to 93.0% in the Struc-

ture 1 and Structure 2 deposits of the same Period.

Birds played a larger role in the diet during the Early Period than they did in the Late Period in both areas of the site. They were most important in the Early Period core and south wing of the Main House (10.4% in Block D and 7.2% in Block E). Birds contributed only 2.8% of the biomass in the Early Period Structure 1-2 area. A similar percentage (2.5%) of birds was contributed in the Late Period Structure 1 and 2 area deposits, but the importance of birds dropped considerably in the Late Period Main House deposits (to 1.7% in Block D and 1.9% in Block E).

Reptiles and amphibians (mostly turtle) in the Early Period contributed more to the Main house diet than to the diet in Structures 1 and 2. In the Late Period, their importance dropped off at the Main House but remained the same in the Structure 1-2 area.

Fish played the greatest role in the diet of the Structure 1-2 area, in both Early and Late Periods, although, even there, fishes decreased in importance through time. The fish percentage in the Main House deposits dropped considerably through time.

In terms of numbers of individuals, the percentages remain relatively stable in the Structure 1-2 area for both periods, with the greatest number of individuals represented by fish and mammals, followed by birds, then reptiles/amphibians. For the Main House deposits, mammals are greatest in number during both periods, but increase in proportion through time; birds and fish remain relatively stable but reptiles/amphibians decrease sharply through time.

In the Structure 1-2 area, fish represent the greatest number of individuals during the Early Period ($n=25$), but they provided only 6.2% of the biomass; during the Late Period ($n=27$), they provided even less, 2.9% of the total biomass. In both periods mammals provided the greatest percentage of biomass, although fewer individuals were represented in each period than for fish. The numbers of individuals and biomass contributions for birds and reptiles/amphibians remained relatively stable for the Early and Late Period Structure 1-2 area.

Although the actual number of bird individuals for each period of Main House deposits is similar to the actual number of bird individuals

identified for the Structure 1-2 area in each period, birds contributed a greater percentage to the overall number of individuals in the Main House deposits than they did in the Structure 1-2 area deposits, in both periods. In the Early Main House deposits, these individuals also contributed a greater percentage of the biomass than did the bird individuals in the Structure 1-2 area. This changes in the Late Period, when bird individuals contributed slightly more percentage of the biomass in the Structure 1-2 area than they did in the Main House area.

Reptiles and amphibians played a greater role in the Main House deposits in the Early Period than they did in the Early Period Structure 1-2 area deposits. However, although there were more individuals in the Late Period Structure 1-2 area deposits, they contributed about the same percentage to the total biomass as did the fewer individuals in the Late Period Main House deposits.

Although there were only slightly more total MNIs in the Late Period deposits (n=114) compared to the Early Period deposits (n=102), those in the Late Period comprised nearly three times the biomass (107.10 kg) of the Early Period (36.54 kg). This is accounted for, primarily, by a large increase in the amount of meat contributed by mammals in the Late Period. In the Structure 1-2 area deposits, 21 mammal individuals com-

prised 22.73 kg of biomass in the Early Period and 23 mammal individuals comprised 42.63 kg of biomass in the Late Period. In the core and south wing of the Main House (Block D), 11 mammals comprised 8.19 kg of biomass in the Early Period and 10 mammals provided 22.75 kg of biomass in the Late Period. In the core and north wing of the Main House (Block E), both the number of mammal individuals and the biomass represented by them increased markedly from Early to Late Periods.

Discussion of Specific Animal Groups Domesticated Animals

The context in which cattle contributed the most to the diet was the Late Period north wing and core of the Main House (55.2% of total biomass) (Table 10). However, beef was fairly important also in the Early Period deposits associated with the south wing and core of the Main House, and in the Late Period deposits of the interior of Structure 2. Beef contributed one-fourth to one-third of the biomass in the Structure 1/Kitchen interior and general exterior deposits around Structures 1 and 2 in both periods, and in the Late Period deposits of the south wing and core of the Main House. Through time, beef increased in importance to the diet in both areas of the site.

With the exception of F. 66, the Late Period fireplace in the north wing of the Main House (which has a very small sample size), the highest percentage of pig remains was found in the Early Period deposits from the interior of Structure 2 (39.7%). The Early and Late Period Structure 1 interior, the Early Period exterior deposits of Structures 1 and 2, and the Late Period south wing and core of the Main House all have similar percentages of pig remains. Pig was least important in the Early Period core (2nd [red] deposits) of the Main House in Block E (3.9%) and in the Early Period (2nd deposits) associated with the south wing and core of the house in Block D (5.7%). Pig remains comprised a greater percentage of biomass in the Early Period interiors of Structures 1 and 2 than in the contemporaneous exterior deposits around those structures. The importance of pig decreased in the Structure 1-2 area through time while increasing in the deposits associated with the Main House.

Sheep/goat remains are present only in deposits associated with the Main House, and primarily in the Early Period deposits around the core and south wing of the house. While present in the Late Period deposits south and north of the Main House, sheep/goat contributed only small percentages of the total biomass there, indicating a decrease in consumption of lamb/mutton through time.

Horse is represented only by two very worn teeth and an astragalus, or ankle bone. Horse occurs only in the Late Period deposits associated with the Main House, in the two cistern areas.

Chicken (including cf. chicken) is found in all areas of the site, and contributed most to the diet in the Early Period deposits of the south wing and core of the Main House. Chicken seems to decrease in importance through time in the Main House deposits, but remains relatively stable in its contribution to the diet in the Structure 1-2 deposits.

Turkey, which could be domestic or wild, is present only in the Late Period interior deposits of Structures 1 and 2, and in very small amounts. It is included here with domestic species, although its location on the site might suggest it was wild.

Wild Mammals

There is quite a bit of variation in the occurrence of wild mammals at the site (Table 11). White-tail deer is present only in the Early and Late Period Structure 1/Kitchen interior and the Early Period general exterior of the Structure 1-2 area, being most important to the diet in the Early Structure 1/Kitchen interior.

Raccoons and rabbits (mostly swamp rabbits) are present only in the deposits associated with the interiors of Structures 1 and 2. Both groups generally decreased in importance through time.

Raccoon was most prevalent in the general exterior deposits around Structures 1 and 2 in the Early Period; rabbits were most important in the Structure 1 interior in the Early Period.

Opossum is present in the Structure 1-2 area in both periods and in the Early Period deposits associated with the south wing and core of the Main House; it plays a larger role in the diet in the Structure 1-2 area, however. Its importance decreased slightly through time in the Structure 1-2 area.

Squirrels are present in very small amounts in both areas of the site, in the Late Period Structure 1 interior, the Early Period south wing and core of the Main House, and the Late Period north wing and core of the Main House.

Eastern woodrat remains are present in both areas of the site, also, although it is most prevalent in the Early Period deposits associated with the core of the Main House (Block E); however, the earliest of these (and the largest percentage, 4.1%) is a very small sample and should be taken with caution. Woodrats are present in small amounts in the Late Period Structure 1 interior and the general exterior deposits of the Structure

1-2 area in the Late Period, as well as in the Early Period deposits associated with the south wing and core of the Main House. Woodrats could represent commensal species here, but since they can get fairly large (up to the size of a small squirrel), they might also be food remains.

Wild Birds

Wild birds occur more evenly across the site than do wild mammals (Table 12). Waterfowl, represented here by ducks and geese, are found in both areas of the site. They are most important to the diet in the Late Period Structure 1/Kitchen interior (1.9% of the total biomass) and the Early Period deposits associated with the core of the Main House (Block E) (1.9%). They occur in smaller amounts in other contexts, suggesting a decrease in importance in the Main House diet and an increase in importance in the Structure 1/Kitchen diet, through time.

Doves and/or pigeons occur only in very small amounts and only in the Early Period exterior deposits of Structures 1 and 2 and in the Late Period Structure 1 interior.

Reptiles and Amphibians

Turtles are the most abundant reptiles in the assemblage and are found in both areas of the site and in both time periods (Table 12). They were most important to the diet in the Early Period deposits associated with the core of the Main House (9.0% in Block D and 9.7% in Block E), and they

decreased in importance there through time. In the Structure 1-2 area, turtle is most important in the Early Period Structure 2 interior deposits (3.0%), but is important to a similar degree in the Late Period Structure 2 interior (2.3%) and general exterior deposits around Structures 1 and 2 (2.3%).

Alligator is represented by one skull fragment only, and is present only in the Late Period general exterior deposits associated with Structures 1 and 2.

Frog or toad remains occur in very small amounts and only in deposits associated with the Early and Late Period interiors of Structure 1/Kitchen and the Early Period core of the Main House (Block E). Unidentified snake remains also occur in very small amounts and only in the Early Period (earliest) deposits of the core of the Main House (Block D).

Fish

Fish occur across the site but are most prevalent in the Structure 1-2 area (Table 13). Bowfin and gar are present primarily in that area. However, bowfin was most important (0.5% of the total biomass) in the Early Period deposits associated with the south wing and core of the Main House. Gar is present in very small amounts in Early Period deposits associated with the core of the Main House (Block E). Both species occur in similar percentages in both Early and Late Periods in the Structure 1-2 area, although bowfin was slightly more important to the diet there than gar.

Suckers occur only in the Structure 1/Kitchen interior deposits, and are present in

both Early and Late Periods; slightly more occurs in the Early Period.

Catfishes were more important to the diet in the Structure 1-2 area, although they occur in small amounts in the Early Period south wing and core of the Main House (Block D) and the Late Period north wing and core deposits (Block E). Catfishes comprised similar percentages of the diet in Early and Late Periods in the Structure 1-2 area.

Sunfishes occur in small amounts in deposits associated with the Main House; they were slightly more important in the Structure 1 interior deposits of both Early and Late Periods.

Freshwater drum contributed the greatest amount of biomass of any of the fish groups and was most prevalent in the Structure 1-2 area. Drum decreased through time in the Structure 2 interior and general exterior deposits around Structures 1 and 2, but increased slightly in the Structure 1/Kitchen interior deposits. Drum also occurs in the Early Period (red) deposits associated with the core of the Main House (Block E).

Aquatic versus Terrestrial Habitats

In both areas of the site and in both time periods, terrestrial species were the greatest percentage of those used (Table 14). Their importance increased through time in the Structure 2

interior and general exterior deposits around Structures 1 and 2, while remaining stable through time in the Structure 1/Kitchen interior. However, the aquatic species increased slightly through time in the Structure 1 interior, and decreased sharply in the Structure 2 interior and general exterior deposits there. The species occupying both habitats, or those indeterminate, decreased also in the Structure 2 interior and general exterior deposits there, but remained the same in the Structure 1 interior.

In the Main House deposits of the Early Period, there is much more variation. In the earliest and second midden deposits of the core and south wing of the house, terrestrial species comprised 86.9% and 86.4% of the biomass, respectively. Aquatic species were more important in the second midden deposits than in the earliest core deposits or in the undifferentiated Early Period south wing and core deposits. The high percentage of aquatic and/or terrestrial species in the earliest and second midden deposits are explained by a relatively high percentage of turtle biomass in the earliest core and a relatively high percentage of unidentified bird biomass (which could be from either terrestrial or aquatic birds) in the sec-

ond midden. The higher percentage for terrestrial species in the undifferentiated south wing and core deposits and the lower percentages for the other categories might indicate that if these early deposits were all lumped, the trend might be more like that in the undifferentiated deposits.

The earliest deposits associated with the core of the Main House in Block E are so small that they should be viewed with caution; however, the second (red) deposits there are more reliable. There we see the highest percentage of aquatic and/or terrestrial species (16.5%), due mainly to high unidentifiable bird and high turtle percentages. The aquatic species are similar in proportion to those from the Early Period Structure 1-2 area, and the terrestrial species percentage is the lowest of all proveniences, Early or Late Period (76.6%).

In the Late Period, all contexts exhibit an increase in the use of terrestrial species and a corresponding decrease in the use of aquatic species and species which occupy both habitats (or are indeterminate). The only exception to this is the Structure 1/Kitchen interior, which sees only a slight increase in the terrestrial species; an increase in aquatic species when the other contexts

decrease; and no change in the importance of the terrestrial and/or aquatic (or indeterminate) species. The shift toward terrestrial species is most dramatic in the Main House deposits. Even with an increase in terrestrial species in the Late Period, there is still a greater use of aquatic species by occupants of Structures 1 and 2 than at the Main House.

Eggshell

Absolute numbers of eggshell fragments cannot be compared between contexts because of the sampling of the Late Period assemblage and because of the breakage of the eggshell, which

can inflate the number-by-number comparisons. However, presence and absence of eggshell can be used for comparison (Table 15). It is striking that, although both would have been interior locations (and therefore more likely to preserve eggshell fragments), eggshell is prominent in Structure 1 but absent from Structure 2. This might be modified in the Late Period if more proveniences were analyzed, but the Early Period differences are real. The Early Period exterior deposits around Structures 1 and 2 contained no eggshell, and only a small amount was found in the Late Period exterior deposits there.

Table 15. Eggshell Fragments (# of fragments).

The deposits associated with the Main House contained eggshell in both Early and Late Periods, but it does not seem as prevalent there as inside Structure 1. This suggests, however, at least some food preparation at the Main House. Eggshell was recovered in the Early Period south wing and core of the house and the Late Period north wing and core. Much of the eggshell found at the site is probably from chicken eggs, although the presence of goose remains leaves that possibility open as well.

Butchering Practices and Meat Cuts Possible Evidence of Butchering Locations

Although head and foot elements do not necessarily indicate primary butchering of animals (since those portions could be remains of food as well), if there are concentrations of head and foot bones in some locations, this might indicate areas where butchering often was carried out. Loose teeth are not included here as head parts unless they are the only skeletal element present.

The location with the strongest evidence of primary butchering of cattle is the Late Period Structure 2 interior, where 46.7% of the cattle cuts/portions are head and foot elements (Table 16). The location with the least evidence of pri-

mary cattle butchering is the Late Period Structure 1/Kitchen interior (8.3% are head and foot elements). There is a marked decrease through time in cattle head and foot parts in the Structure 1/Kitchen interior, with a marked increase in the interior of Structure 2. There seems to be a decrease in these elements through time in the Main House deposits. Overall there seems to be less evidence for primary butchering near the Main House and more evidence for it in the Structure 1-2 area.

There are generally more pig head and foot elements throughout the site than there are cattle head and foot elements, indicating primary butchering and/or consumption of those cuts of pork more than of beef. The highest percentages of pig head and foot elements are from the Early Period general exterior of Structures 1 and 2 (54.6% of the pig cuts/portions are head and foot elements) and the Late Period north wing and core of the Main House (52.0%), although the Late Period interior of Structure 2 has a relatively high percentage of these elements also (42.9%).

All but one of the sheep/goat elements are head or foot elements; the exception is one thoracic vertebra fragment from the Late Period south wing and core of the Main House.

Horse is represented only by two very worn teeth and an astragalus bone (from the foot/hindshank). There is a possible cut mark on the astragalus, but it cannot be determined with certainty to be a butchering mark.

Meat Cut Summary

In terms of the actual numbers of cuts/portions represented, there is a marked increase in beef cuts through time in the Structure 1-2 area, as well as in the Main House deposits (Table 17).

Pork cuts remain relatively stable through time in the Structure 1-2 area, but increase dramatically in the Main House deposits. Sheep/goat cuts occur infrequently, but decrease slightly through time in the Main House deposits. Horse, if it is food remains, occurs only in the Late Period deposits associated with the Main House. Deer cuts decrease slightly through time in the Structure 1-2 area, and occur only there.

Detailed Meat Cut/Portion Data

A general idea of economic differences among the areas of the site may be gotten by looking at detailed data on meat cuts/portions from each context (Tables 18-20).

For the interior of Structure 1 in the Early Period, beef cuts are of medium quality and loose teeth and foot elements are present (Table 18). In the Late Period, however, a few high quality cuts of beef are present, along with loose teeth and

foot elements. Pork cuts in the Early Period include high and medium quality cuts, as well as loose teeth and foot elements. In the Late Period, the pork cuts are much more limited and of rather medium quality; loose teeth and foot elements are present. Venison is present in a haunch/ham in the Early Period and a shoulder in the Late Period, both good quality cuts (although not the highest, such as the loin).

In the interior of Structure 2 in the Early Period, no beef is present at all; the pork cuts are medium to high quality, but limited; head elements are present. In the Late Period, pork cuts/portions are of medium to high quality and include a steak; loose teeth and foot parts are present. Beef cuts in the Late Period are fairly numerous and of medium to high quality; head and foot elements are present.

In the exterior deposits around Structures 1 and 2 in the Early Period, beef cuts are of medium quality, with loose teeth and foot elements present. In the Late Period, the beef cuts increase in quality somewhat but still include loose teeth and foot elements. Pork cuts in the Early Period are of medium quality and include head and foot elements. In the Late Period, the pork cuts are of low to medium quality and very limited, with teeth and foot parts present. Venison cuts (shoulder) occur only in the Early Period in this context.

The most dramatic change in meat cuts is seen in the south wing and core area of the Main House (Table 19). In the Early Period, the beef

cuts are of medium quality and include head and foot elements; in the Late Period, the quality greatly increases, as does the number of cuts, including many steaks. Pork cuts/portions are very limited and of medium quality in the Early Period, with teeth and foot bones present; in the Late Period, the cuts are of medium to high quality, with several steaks included, and teeth and foot bones are present. Sheep/goat cuts/portions are only teeth and foot elements in the Early Period and shift to a shoulder/rack cut in the Late Period.

The context with the highest quality of beef and pork cuts and by far the greatest number of cuts in evidence is the Late Period north wing and core of the Main House (Table 20). Head and foot elements are present for cow, pig, and sheep/goat as well.

Cisterns

The faunal materials from the two cistern locations near the Main House are similar to and different from the larger area deposits (Table 21). The cistern midden in Block E contains none of

the medium and small mammals or various fish species that are present in the overall Late Period north wing and core of the Main House deposits. The cistern midden has slightly lower percentages of bone weight for mammal, fish, and bird remains, and a higher percentage of reptile/amphibian remains than the overall biomass percentages in the Late Period in Block E.

Horse teeth, cow head elements, and pig foot elements were found in the cistern assemblage, but the rest of the cow and pig elements are from most parts of the skeleton. There seems to be no evidence of specialized processing of large

mammals in the cistern area. No bird skull or foot elements were found, although the chicken tibio-tarsus could represent butchering; the bird elements seem to be from food refuse (i.e., they are meat-bearing elements). The only snow goose to occur in Late Period north wing and core deposits is the one from the cistern.

The cistern midden in Block D, south of the core of the Main House, does not contain the rodent and duck remains found in the overall Late Period midden associated with the south wing and core of the Main House. The relative percentages of the animal classes in the cistern deposits are about the same for mammals, slightly lower for birds and fish, and higher for reptiles/amphibians, than the percentages for the overall Late Period midden associated with the south wing and core.

Horse tooth and foot/hindshank elements, pig head and foot elements, and cow head elements are present, but the rest of the cow and pig elements are from most parts of the skeleton. The sheep/goat element is a vertebra; this is the only sheep/goat bone in the Late Period south wing and core deposits. Horse occurs only in the cistern deposits.

No bird skull parts were found here, but the tarsometatarsals (chicken and swan/goose) could represent butchering (and/or food also). The other bird elements would be expected from food refuse rather than from butchering.

Fireplaces

Four fireplaces were revealed in the excavations. One was located in the Late Period north wing of the Main House (F. 66), which has been discussed at length above. One was located inside the south wing of the Main House (F. 84); faunal material was recovered from the Early Period deposit of this fireplace. The very small assemblage consisted of 24 fragments (adjusted fragment count) weighing 59.2 grams. It contained cow, sheep/goat, unidentifiable large mammal, unidentifiable mammal, and chicken remains. Cut marks and gnawing marks are evident on several bones, but no burned or calcined bone was found. This suggests that very little cooking of animal food was done in this fireplace and no burning of food refuse as a disposal practice was carried out.

Two fireplaces were revealed in Block C. An Early Period hearth in the floor of Structure 2

(F. 152) contained a very small assemblage of four fragments of unidentifiable mammal and unidentifiable bone weighing 1.5 grams. One of the unidentifiable mammal bones is calcined. This, again, does not indicate that a large quantity of animal food was cooked in the fireplace or disposed of by burning; however, a large quantity of bone refuse was found inside the structure, indicating food preparation and consumption there, and the highest percentage of burned/calcined bone (21.8%) was found inside the Early Structure 2. This suggests there was frequent clearing out of the hearth itself.

The second fireplace found in Block C is that inside Structure 1/Kitchen (F. 116). This more substantial fireplace, wood-and-clay in the Early Period and brick in the Late Period, contained much more bone than either of the other two fireplaces (Table 22). The remains associated with the Early Period fireplace were mostly mammal and fish, while those in the Late Period fireplace were mostly mammal and bird. Through time, there was an increase in the proportion of mammals, birds, frog/toad, and unidentifiable bone, and a decrease in the proportion of fish in the fireplace deposits.

The percentage of burned and calcined bone changed through time as well. In the Early Period fireplace, 28.8% (n=89) of the bones were burned/calcined; in the Late Period fireplace, only 4.3% (n=9) were burned/calcined. Of the total burned/calcined bone found in the Early Period Structure 1 interior (n=174), 51.2% (n=89) was located in the fireplace; in the Late Period Structure 1 interior, of the total

Concluding Thoughts

The contexts at Nina Plantation do not provide as clear a case for ethnic and economic distinctions to be drawn as one might like, since Structure 1 probably served as a residence for African American slaves and tenants as well as a kitchen for the Main House residents and since the function of Structure 2 is somewhat less clear. However, if we assume that the food refuse found around the Main House is left from foods consumed there, and that at least some of the food refuse found in and around Structures 1 and 2 is left from foods consumed there, then some broad distinctions may be drawn. Three different pat-

terns of food consumption emerge, and although distinct, they grade into each other as well.

The Structure 1 and Structure 2 area appears, from the material culture, to have been where African Americans resided, both as slaves and as servants or tenants. Deer, raccoons, rabbits, turkey, doves and pigeons, alligator, and suckers were consumed here and nowhere else on the site. The residents also ate species that were consumed at the Main House, including cow, pig, chicken, squirrel, ducks and geese, and turtles. Some species, such as opossum, occur in small amounts at the Main House but in larger amounts in the Structure 1-2 area. This is especially true of fish; although catfishes, gar, bowfin, drum, and sunfishes occur at the Main House, they play a much greater role in the diet in the Structure 1-2 area.

The Early Period deposits associated with the Main House correspond to the residence there of the French Jarreau family. In addition to cow, pig, sheep/goat, and chicken, the French also consumed small amounts of opossum, squirrel, turtle, bowfin, gar, catfishes, sunfishes, and drum. They relied more heavily on chicken than did the other site residents and used the domestic mammals in relatively even proportions. Their dependence on domestic species was similar to that in Structures 1 and 2, but they depended on wild species to a much lesser degree.

The Late Period deposits associated with the Main House result from a series of Anglo-American residents. It is in this Late Period that we see a marked increase in dependence on domestic species and little use of wild species at all; only ducks and geese, turtles, sunfishes, and catfishes were even slightly important. The Anglo-American residents also relied less on chicken than either the French or African Americans. A preference for beef over pork seems apparent in the Late Period deposits and an overall increase in expensive and preferred cuts of meat suggests residents of higher economic status than the Jarreaus before them.

Whether these distinctions can be attributed more to ethnicity than economic position is less certain than the fact that the differences do seem to be there. This analysis, however, provides a solid base of data which hopefully can be used to address these and other questions through inter-site comparisons in the future.

SCOPE OF SERVICES

SECTION C
DESCRIPTION/SPECS./WORK STATEMENT

**Archeological Data Recovery
at the Nina Plantation Site in Pointe Coupee Parish, Louisiana**

C-1. Introduction. An extension of the Grand Bay Revetment located on the west bank of the Mississippi River in Pointe Coupee Parish is planned for construction in 1993. The archeological remains of a plantation site determined eligible to the National Register of Historic Places were recently identified within the project right-of-way. Historical research indicates that the site is the remains of a 19th Century sugar/cotton/rice plantation known as Nina Plantation. Remains of the main house and the quarters are located along the cut bank of the river within the project right-of-way. Construction plans call for bank grading and the placement of a concrete revetment along the river bank which will impact the eroding site. The purpose of this investigation is to mitigate impacts to significant cultural resources through a controlled archeological data recovery program.

C-2. Location of Work. The study area is located on the west bank of the Mississippi River in Section 16, Township 4 South, Range 11 East, New Roads, LA 15 minute quadrangle map (See Section J). Specifically, the study area is defined as the portions of the Nina Plantation site located within 100 feet of the top of the Mississippi River bankline.

C-3. Background Information. A cultural resources survey of the Grand Bay Revetment right-of-way was conducted by Earth Search Inc. in 1991-1992 (Earth Search Inc., 1992). The archeological remains of Nina Plantation were located during this survey and reported to the Corps of Engineer, New Orleans District and the Louisiana Division of Archaeology. A site number was issued (16PC62). Five separate localities were found: Locus A, a brick rubble area in the cut bank; Locus B, a floor of crushed brick; Locus C, an artifact scatter; Locus D, a second artifact scatter and a brick pier; and lastly Locus E, another artifact scatter (Section J). All three artifact scatters contained architectural debris, ceramics, and glass dating to the 19th century. Features associated with the former sugar house were also found alongside the borrow pond. These features included a massive masonry foundation possibly serving as a support for sugar processing machinery and a course of bricks eroding out of the slope of the borrow pond. Because of the presence of intact features and a rich cultural deposit, the site was evaluated as potentially eligible for inclusion in the National Register of Historic Places.

Additional testing was conducted at the site to further define the archeological remains. Historical records and map evidence indicated that Nina Plantation was a 19th Century sugar/cotton plantation.

Test excavations consisted of eleven backhoe trenches representing 210 linear meters

which were excavated to depths averaging 160 cm. below surface. The culture bearing stratum was generally located beneath about 1 meter of silty overburden. Nine groups of features were located which were cultural in origin. These features were associated with four major locales: the sugar house ruins, the quarters complex, the great house and a possible kitchen area (Locus D) associated with the main house (Section J).

A rice flume was recently discovered by Corps archeologists during a site visit. The river stage had dropped significantly (approximately 14 feet) since the archeological testing had been conducted at the site and had exposed the flume just a few feet above the water surface. This flume will be investigated in the data recovery project.

The archeological testing at Nina Plantation provided information which allowed Earth Search Inc. to recommend that the site is eligible for the National Register of Historic Places under criterion D. The site has potential to yield important data which are relevant to our understanding of history and it exhibits the quality of integrity. The data contained in the site allows for inter- and intra-site comparisons (Attachment 3). Three major research issues will be investigated utilizing data recovered from the site. These research issues are: 1.) the examination of the material culture of planter and slaves/freedmen on a plantation that cultivated both sugar and cotton; 2.) a comparison of the diets of the planter and slaves/freedmen; and 3.) examination of the plantation layout of buildings. Additional research issues may be developed and presented in the contractor's proposal for this project.

C-4. General Nature of the Work. The work to be performed by the contractor consists of archeological data recovery. This work will be performed as specified in this scope of services and the approved Contractor's research design.

C-5. Study Requirements. The study will be conducted utilizing current professional standards and guidelines including, but not limited to:

- * the Secretary of the Interior's Standards and Guidelines for Archeology and Historic Preservation as published in the Federal Register on September 29, 1983;
- * the Louisiana Division of Archaeology's Comprehensive Archeological Plan dated October 1, 1983 and the Cultural Resources Code of Louisiana, June, 1980.
- * the Advisory Council on Historic Preservation's Handbook entitled "Treatment of Archeological Properties, February 1981.
- * the Department of Interior's 36 CFR Part 66 Recovery of Scientific, Prehistoric, Historic, and Archeological Data: Methods, Standards, and Reporting Requirements Proposed Guidelines", Federal Register, Vol. 42, No. 19 - January 28, 1977.

The study will be conducted in four phases: Fieldwork, Data Analysis, Report Preparation and the Preparation of a Popular History on the Nina Plantation site.

A. Phase 1 Fieldwork.

The goal of the fieldwork is to address the research questions presented in this scope of work and the contractor's research design. In order to accomplish this goal, the contractor will:

1. investigate the rice flume which was located at low water along the cut bank. This flume will be exposed, excavated, photographed, and recorded. The excavated soil will be screened through 1/4 inch mesh. This flume will be examined with reference to other rice flumes, such as the one found at the Vacherie site (16SJ40).
2. excavate backhoe trenches perpendicular to the bank line at 10 meter intervals across the site area. The contractor will extend these trenches from as close to the riverbank as safely possible, and back to the furthest extent of proposed bank grading and clearing for the grading. It is estimated that project impact will extend to 100 feet from the bank line. Midden deposits will be excavated mechanically and trowelled for artifacts. The provenience for all artifacts will be recorded. Screening of all soils from culture bearing levels will not be performed because adequate recovery of artifacts to address the research questions are expected through recovery by trowel and the screening of features. An adequate sample of each trench unit will be hand excavated and subject to screening through 1/4 inch screen mesh to test the efficacy of the trowelling approach to artifact recovery.
3. expand trenches mechanically to block excavations to define selected structure size, construction details, activity areas, and features. Again, excavated soils will be trowelled to recover artifacts. Structures to be exposed include the great house, the kitchen, and two slave/freedmen quarters. This will result in a larger area being exposed and the possibility of uncovering more features which could provide information better suited to answer the research questions proposed in the data recovery plan. The top meter of overburden will be removed by backhoe, since the cultural deposits at the site are buried beneath 1.3 to 1.5 meters of sterile alluvium.
4. hand excavate all features and screen all soils from features through 1/4 inch mesh. All features uncovered will be mapped, photographed, and recorded. Features partially exposed in the trenches will be fully uncovered and excavated through trench expansion. Soil matrix samples of a controlled volume (at least 20 liters) will be removed from all feature levels and water screened through 1/4, 1/8, 1/16 inch mesh for recovery of small artifacts (such as seeds, and animal bones). Additionally, a 2 liter matrix sample will be obtained for flotation.

In general, all activity areas and features located will be mapped, photographed, and excavated using standard methods to determine depth of deposit, activity area boundaries, stratigraphy, condition, and cultural association. At a minimum, the site map will show activity area boundaries, locations of features and artifact scatters, locations of all subsurface trenches and testing units, and prominent natural and cultural features in the site area. All excavation units, trenches, etc. will be immediately backfilled upon completion of archeological recordation. The field work will be completed within 12 weeks after notice to proceed.

The 12 week schedule for fieldwork assumes that Mississippi River stages will not hinder the conduct of field operations. With the exception of the rice flume, the site can be accessed and excavated when river stages are below 25 feet N.G.V.D. on the Baton Rouge gage. The rice flume is not subaerially exposed until the river stage drops below 12 feet on the Baton Rouge gage.

For each week that Mississippi River stages meet or exceed 25 feet N.G.V.D. on the Baton Rouge gage during the fieldwork phase of the project, the schedule will be adjusted 1 week. The river may not be low enough during the first 12 weeks of the contract to allow excavation of the rice flume. In that case, the excavation of this site feature can be delayed until stages drop during the data analyses and report preparation stage of the project.

The Contractor will file an updated state site form with the Louisiana Division of Archaeology. The form will correct previously filed information where appropriate and summarize the results of the present investigation. Two unbound copies of the site update form will be submitted to the COR with the draft report.

B. Phase 2: Data Analyses. All data will be analyzed in accordance with currently acceptable scientific methodology. The Contractor shall catalog all artifacts, samples, specimens, photographs, drawings, etc., utilizing the format currently employed by the Louisiana Division of Archaeology. The catalog system will include site and provenience designations. The analyses will be fully documented in the project report. Methodologies and assumptions employed will be explained and justified. Inferential statements and conclusions will be supported by statistics where possible.

Artifacts recovered from the excavation will be utilized to examine patterns of artifact distribution. The frequencies of artifacts categories will be plotted using a computer contouring program. Results will be compared to other sites in Louisiana. The terminus post quem for ceramics and other datable objects will be determined in order to date features and cultural deposits. Comparisons between slave/freedmen and planter will be made using the associated material assemblage of each in order to determine if there are any differences which could be attributed to socio-economic level or ethnic background. The faunal and floral material recovered from features will be separated for analyses. Identification of species, elements, age and sex will be conducted as well as the calculation of MNI.

C: Phase 3: Report Preparation. All data collected under the auspices of this contract will be recorded, analyzed, and reported using currently acceptable scientific methods. The Contractor shall integrate all observations and the results of data collection and analyses into a written, comprehensive, and graphically illustrated report of investigation.

A draft copy of this report will be submitted to the COR prior to submittal of the final report. The draft report will be reviewed by the COR, Technical Representative and other state and Federal agencies, peer reviewers, or interested individuals. Review comments will be provided to the Contractor. Within the specified delivery schedule, the Contractor shall incorporate or resolve all comments with the approval of the COR and submit one preliminary copy of the final report. Upon approval of the preliminary final report by the COR, the Contractor shall submit the final report in the number and within the schedule specified in this contract.

The project report will include information on Nina Plantation which is provided in the initial cultural resources survey report (Section J). This previous report provides a literature review, explanation of the geomorphic conditions, results of the historic maps and records search, the prehistoric and historic setting as well as the land use history. All of this information will be incorporated into the draft report on the data recovery project at the plantation site. The draft report will also provide more detailed information on the three research issues proposed for investigation in the previous report as well as any additional research issues developed as a result of the data recovery project.

The Contractor shall digitize the following historic maps which will be useful for understanding the relationship of historic buildings and bank lines with regards to present conditions. These maps are: 1) the 1882-1883 Mississippi River Commission Map, Chart 64; 2) the 1921 Mississippi River Commission Map, Chart 64; and 3) the Ca. 1890 levee set back map (see Section J). The Nina Plantation site map will also be digitized. The use of an Intergraph CAD system for this effort is recommended but not required. What is required, however, is perfect compatibility with NOD Intergraph system. In order to ensure compatibility, the Contractor CAD technician shall consult with the COR at the initiation of his work for the design guidance. Upon complete digitization of the first historic map, the Contractor shall submit the drawing and the design files in "dgn" format to the COR for his review and approval. Once approved, the Contractor shall proceed with the mapping effort. Computer generated surface plots and maps of artifact distributions will also be incorporated in the project report.

D. Phase 4: Production of Popular History Booklet The significance of archeological and archival research on Nina Plantation and the role the Corps of Engineers played in uncovering this information will be presented in a popular history prepared by the contractor. The results of the previous archival and historical research, along with the results from the data recovery project at Nina Plantation shall be incorporated into a booklet directed to the lay public. This popular history will be presented in a well illustrated, and readily understood format. One copy of a camera ready popular history will be presented to the COR. The United States Army Corps of Engineers, New Orleans District will arrange for publication of this booklet. A meeting with the COR, Technical

Representative, and Contractor will be scheduled after submission of the final report to discuss what information would best be presented in this booklet. Additional meetings will be scheduled to discuss format, style and illustrations.

C-6. Reports:

a. Monthly Progress Reports. Throughout the duration of this contract, the Contractor shall submit to the COR one copy of a brief but concise monthly statement of progress. These reports, which may be in letter form, should summarize all work performed, information gained or problems encountered during the preceding month. A concise statement and graphic presentation of the Contractor's assessment of the monthly and cumulative percentage of total work completed by phase shall be included each month. Each month, the Contractor is expected to review work in progress to determine the probability of meeting scheduled completion dates. The Contractor shall notify the COR of any inability to meet scheduled completion dates in a timely manner, at or before the point of fifty percent (50%) of the original time and cost estimate has been depleted.

b. Phase 1 Data Recovery Management Summary. Two copies of a brief management summary which presents the results of the data recovery project will be submitted to the COR within 2 weeks after fieldwork is completed (14 weeks after notice to proceed). This report will include a brief description of each activity area and features recorded during data recovery.

c. Draft and Final Reports (Phase 1-3). Nine copies of the draft report integrating the results of the data recovery and artifact analysis phases of this investigation will be submitted to the COR for review and comment within 52 weeks after notice to proceed. Along with the draft reports, the Contractor shall submit:

- (1) One copy of the aerial mosaic project maps, marked with the locations of the site;
- (2) two unbound copies of the site update form.

The written report shall follow the format set forth in MIL-STD-847A with the following exceptions:

- (1) separate, soft, durable, wrap-around covers will be used instead of self covers;
- (2) page size shall be 8-1/2 x 11 inches with 1-inch margins;
- (3) the reference format of American Antiquity will be used. Spelling shall be in accordance with the U.S. Government Printing Office Style Manual dated January 1973.

The COR will provide all review comments to the Contractor within 8 weeks after receipt of the draft reports. Upon receipt of the review comments on the draft report, the Contractor shall incorporate or resolve all comments and submit one preliminary copy of the final report to the COR within 6 weeks (66 weeks after notice to proceed). Upon approval of the preliminary final report by the COR, the Contractor will submit 75 copies and one reproducible master copy of the final report to the COR within 70 weeks after notice to proceed). The Contractor will also provide computer disk(s) of the text of the

final report in Microsoft Word or other format approved by the COR. Included as an appendix to the Final Report will be a complete and accurate listing of cultural material and associated documentation recovered and/or generated.

d. Phase 4 Popular History A draft copy of the popular history will be submitted 8 weeks after submission of final report (78 weeks after notice to proceed). The COR will provide comments to the contractor within 8 weeks of submission of the draft popular history. These comments will be incorporated into the final history. One preliminary copy of the final history will be submitted to the COR within 3 weeks (89 weeks after notice to proceed). Upon approval of this final preliminary copy of the report, one reproducible master copy will be submitted along with a copy of the computer disk, within 2 weeks (91 weeks after notice to proceed).

C-7 Disposal of Records and Artifacts. All records, photographs, artifacts and other material data recovered under the terms of this contract shall be recorded, processed, and catalogued in a manner compatible with those systems utilized by the Louisiana State Historic Preservation Office and Federal agencies which store archeological data. Archeological collections and associated records to be permanently curated shall be prepared to meet the standards of 36 CFR Part 79, Curation of Federally-Owned and Administered Archeological Collections. They shall be held and maintained by the Contractor until completion of the contract in a manner compatible so far as possible with these standards. Collections may be inspected by the COR. Final disposition of the artifacts and records will be in accord with applicable Federal and State laws. Unless otherwise specified, artifacts will be returned to the landowner or permanently housed with the Louisiana Division of Archaeology and Historic Preservation or in a repository selected by the State Archeologist. Presently existing private archeological collections from the project area which are used in data analyses will remain in private ownership. The Contractor shall be responsible for delivery of the analyzed archeological materials to the individual landowners, the Louisiana SHPO's office, or any other repository designated by the Government following acceptance of the final report. The Principal Investigator shall inform the COR in writing when the transfer of data has been completed and shall forward to the COR a catalog of items entered into curation. The location of any notes, photographs or artifacts which are separated from the main collections will be documented in the catalog.

C-8 Principal Investigator. The Principal Investigator (PI) shall serve as the principle point of contact and liaison with the Contracting Officer and his representative for all work required under this contract. If it becomes necessary to designate a new PI for the overall responsibility of this contract, written approval of the Contracting Officer is required. The Contractor shall provide to the COR a resume of the proposed replacement PI along with a written request for the proposed change. The PI, key staff members, and key consultants, shall meet the minimum qualification standards promulgated by the Department of the Interior in draft regulations 36 CFR Part 66, Appendix C and 32 CFR 229. Each shall have recognized/demonstrable expertise in the assigned portion of the archeological investigations, and shall be responsible for the validity of the data, statements of significance, and conclusions included in the final

report. It shall be the responsibility of the PI to maintain the delivery schedule as specified in the contract. The PI will be responsible for maintaining standards of conduct, integrity, and competency for Contractor employees and key consultants.

C-9 Government Obligations to the Contractor. The COR will provide the Contractor with the necessary project maps on which the study area is accurately delineated. The New Orleans District will secure right-of-entry for the study area. The Contractor will be provided a written copy of all such rights-of-entry.

C-10 Responsibility of the Contractor. The Contractor will provide a safe working environment for key consultants and all persons in his employ as prescribed by EM 385-1-1, "General Safety Requirements". The Contractor shall be responsible for all damages to persons and property which occur in connection with the work and service under this contract, without recourse against the Government. The Contractor shall provide maximum protection, take every reasonable means, and exercise care to prevent unnecessary damage to existing historic structures, contemporary structures, landscape plantings, natural features, roads, utilities, and other public or private facilities. Special attention shall be given to historic structures, natural and landscape features of the areas. Special care shall be given to protect these elements and their surroundings. The Contractor shall not cut, injure, or destroy vegetation or damage property without written authority from the owner. Procedures outlined in DR 27-2-2, Real Estate Damage Claims, will be adhered to. Human skeletal remains are not expected in study area. However, if any are discovered during the investigation, the COR will be immediately notified and the requirement of Louisiana's Unmarked Human Burial Sites Preservation Act will be strictly followed. The Contractor is a representative of the U.S. Government and of the U.S. Army Corps of Engineers, New Orleans District and as such will refrain from bringing discredit upon the U.S. Government or the New Orleans District by deportment, apparel or verbal expression.

C-11 Publicity. Except with prior approval from the Contracting Officer, the Contractor, any of his employees or consultants shall not release for publication or any other use (including student theses or professional journals) any sketch, photograph, report, or other material of any nature pertaining to any matters for which services are performed under the terms of this contract. The provisions of this article shall extend also to the release of any such material to any person, including the public media and the professional community, not so authorized by the Contracting Officer.

C-12 Contractor's Organization. Prior to the commencement of the contract, the Contractor shall furnish to the COR a chart showing the organization provided for the performance of the work including names and titles of personnel employed in connection with the work. The chart shall include the names and titles of all key consultants and their position in the organization.

During the life of the contract, revised charts shall be submitted in advance of substantial changes in the Contractor's organizational structure.

The Contractor shall be responsible for maintaining satisfactory standards of employee competency, conduct and integrity, and shall be responsible for taking disciplinary action with respect to his employees as may be necessary.

C-13 Partial Payments: Payments will be made according to the following schedule upon submission of proper invoices and acceptance of the deliverables by the COR:

	% of total	Cumulative contract %
a. Phase 1 management summary	40%	40%
b. Phases 1 - 3 draft report	35%	75%
c. Phases 1-3 final report	15%	90%
d. Phase 4 draft popular history report	5%	95%
e. Phase 4 popular history final report	5%	100%

Deliverables will be accepted when the COR determines that they substantially meet all requirements of the scope of services.

SECTION D
PACKAGING AND MARKING

D.1

PACKAGING AND MARKING.

Packaging of completed work shall be in accordance with standard commercial practices and accomplished such that the materials will be protected from handling damage. Shipping labels should be marked as follows:

U.S. Army Engineer District, New Orleans
Post Office Box 60267, CELMN-PD-RN, Room 363
Foot of Prytania St @ Leake Ave
New Orleans, LA 70160-0267

Hand carried submissions should be marked as above.

END OF SECTION D

SECTION E
INSPECTION AND ACCEPTANCE

E.1

INSPECTION AND ACCEPTANCE.

Ordered Services which have been completed will be inspected and accepted in accordance with Clause 52.246-4 entitled "Inspection of Services."

If the services do not conform to the contract requirements, appropriate corrective action will be taken in accordance with the Inspection of Services clause.

END OF SECTION E

SECTION F
DELIVERIES OR PERFORMANCE

F.1

Delivery Schedule

1. Completion Schedule.
 - a. Complete all fieldwork within 12 weeks after notice to proceed (NTP).
 - b. Submit Phase 1 management summary within 14 weeks after NTP.
 - c. Submit Phases 1-3 draft report within 52 weeks after NTP.
 - d. Submit preliminary final report within 66 weeks after NTP.
 - e. Submit final reports within 70 weeks after NTP.
 - f. Submit Phase 4 draft popular history within 78 weeks after NTP.
 - g. Submit Phase 4 preliminary final popular history within 89 weeks after NTP.
 - h. Submit Phase 4 final popular history within 91 weeks after NTP.
2. The total period of performance is 92 weeks commencing from receipt of Notice to Proceed.
3. Schedule listed above assumes water levels in the Mississippi River at the Baton Rouge gage are below 25 feet N.G.V.D. during the performance of the fieldwork (item 1.a. above). River stages at or above 25 feet flood the access road to the site and also raise the water table making the site excavation infeasible. For each week that the Mississippi River stages meet or exceed 25 feet N.G.V.D. at the Baton Rouge gage during the fieldwork phase of the project, the contract schedule (items 1.a.- 1.h. above) will be adjusted 1 week.

SECTION M
EVALUATION FACTORS FOR AWARD

A. Approach to the Work

1. Appropriateness of proposed research, data collection and analyses techniques for this investigation.
2. Detailed and concise explanation of study methodology.
3. Demonstrated understanding of the requirements.
4. Efficient and flexible technical approach to fulfilling the requirements.
5. Adequate commitment of resources to accomplish the work in a timely manner.

B. Organization and Staff Experience and Quality of Work.

1. Record of organization's previous involvement in large and complex cultural resource studies, including but not limited to ability to meet contract schedules, maintain adequate professional staff, produce quality reports, and respond to comments received on draft reports.
2. Experience of Principal Investigator in managing cultural resource investigations of similar magnitude and complexity.
3. Experience and expertise of all other personnel assigned to the various phases of the work.
4. Actual involvement of experienced professionals in data gathering analyses, interpretation and report preparation phases of the work.
5. Office and lab facilities sufficient for large scale projects.

Factors A and B are equivalent in weight. Sub-factors are listed in descending order of importance.

NOTE: Price will not be scored or otherwise combined with the technical evaluation. However, price will be an important evaluation factor. Award will be based on the final offered price provided that it is determined to be reasonable and that the proposal is otherwise

in the Government's best interest.

UPDATED LOUISIANA STATE SITE FORM

**STATE OF LOUISIANA
UPDATED SITE RECORD FORM**

LOCATIONAL DATA

SITE NAME: Nina Plantation

STATE SURVEY NO.: 16PC62

OTHER SITE DESIGNATIONS: Pecan Grove Plantation

SITE LOCATION AND APPROACH: Take LA 415 to intersection with LA 414 and cross levee. Take dirt road across borrow ponds and continue to the southeast. Northern end of site is located at the point that the road turns to the south, parallel to the river.

PARISH: Pointe Coupee

___ of the ___ of Section 16 Township 4S Range 11E

USGS QUADRANGLE: USGS 7.5' Series Topographic Quadrangle, Port Hudson, Louisiana 1980

UTM COORDINATES: Zone 15 Easting ⁶58³⁰ Northing ³³95²⁶⁰

PHYSICAL SETTING

LANDFORM: This site is located behind a natural levee.

GEOMORPHIC PROCESSES: Alluvial deposition with riverine erosion.

ELEVATION AND RELIEF: The elevation is approximately 9.1 to 12.2 m (30 to 40 ft).

NEAREST WATER: The Mississippi River is adjacent to the site area.

POSITION WITH RESPECT TO TERRAIN: The site is located adjacent to the river on the natural levee

SOIL CHARACTERISTICS: Robinsonville silt loams

FLORAL COMMUNITIES: The area is a batture, with remnant evidence of cultivated species (pecan, feral indigo).

FAUNAL COMMUNITIES: The area is a batture.

NEAREST KNOWN SITE: Site 16PC31 (Waterloo) is located near the site.

SITE DESCRIPTION

SITE DESCRIPTION: Nina Plantation was a circa 1820 - 1890 sugar plantation, with stratigraphically intact remains of the main house, two earthfast outbuildings, slave quarters, and the sugar mill. During mitigation excavations, the main house, the two outbuildings, two associated cisterns, a well, and the midden deposits associated with these plantation structures were investigated. The large main house had been raised on brick piers, but the two associated outbuildings had been built using a variety of early French colonial vernacular construction methods, *piquette en terre*, *poteaux sur solle*, and *poteaux en terre*. One of these structures has been identified as a detached kitchen that also served as quarters for domestic slaves and laborers. The other outbuilding also was a residence for household labor.

The stratigraphy of the site was well preserved, and included two major occupational middens, separated by a thick deposit of alluvium, attributed to a severe flood in 1851. This alluvium sealed the bulk of the antebellum cultural deposits, and acted as a temporal marker that extended across the entire site, making it possible to differentiate between construction sequences at the main house and the associated outbuildings. While the construction sequence was not as clear on the interior of the kitchen outbuilding, correlation between the alluvial stratum outside of the building, and the interior strata associated with the construction of a brick chimney foundation, enhanced understanding of the complex sequence of reconstruction events in the kitchen.

SITE SIZE: 340 m (1,115.5 ft) N/S x 230 m (754.6 ft) E/W (maximum)

CONFIGURATION: Roughly triangular (see attached plan)

DENSITY OF CULTURAL MATERIALS: variable, but very high density in formerly occupied areas. Approximately 100,000 artifacts were recovered during mitigation.

DEPTH OF DEPOSIT/STRATIGRAPHY: The majority of the site has approximately 1 meter (3.28 ft) of alluvial overburden that has accumulated since the end of the nineteenth century. The occupational stratigraphy is complex, and includes two major midden deposits, separated by a significant alluvial deposit from 1851. A number of discontinuous occupation and destruction strata are associated with individual structures at the site. The depth of deposit varies from approximately 30 to 60 cm (11.81 to 23.62 in). Absolute elevations established the original occupation surface at 10.95 m NGVD, and the top of the post-occupation alluvial deposition at approximately 12.1 m NGVD.

FEATURES: In the area of the main house and the outbuildings, a total of 216 features were investigated during the mitigation excavations. During the Phase II testing at the site, a number of features associated with the slave quarters and with the sugar house were recorded. Features included foundation piers, sill impressions, postholes, floors, fireplaces, and hearths associated with the various structures at the site. Extensive midden deposits and trash pits were also recorded and investigated. A wood-lined, square well shaft, probably associated with the main house, was located at the low-water line of the river (10.2 m NGVD).

DATING/CULTURAL AFFILIATION: The site was first occupied circa 1822, and was abandoned circa 1890-91. After abandonment, the sugar house continued in use for a short period of time, and the land continued in cultivation.

PRESENT CONDITION/PRESERVATION: The area of the main house and the outbuildings had been threatened by severe erosion, and by a proposed revetment of the bankline. That area of the site has been fully excavated. The sugar house had been impacted by borrow ponds, excavated during construction of the current levee. The quarters, and other outbuilding areas, are still intact and in excellent condition.

PRESENT USE: The batture is used for cattle grazing and hunting.

PRESENT AND FUTURE IMPACTS: Erosion may eventually pose a threat to the slave quarters. The impact of reveting has been mitigated by the Phase III excavations. Any future planned impact to the area of the quarters should be preceded by mitigation excavations.

COLLECTIONS

SURVEY/EXCAVATION METHOD: Phase II - Backhoe and hand excavation within trenches
Phase III - backhoe trenches, mechanical stripping of wide area, hand excavation of 1 x 1 m units

DESCRIPTION OF MATERIAL: ceramics, glass, metals, tools, buttons, pipes, coins, faunal material, miscellaneous personal items, jewelry, guns, ammunition, architectural material

SITE EVALUATION

RESEARCH POTENTIAL: Site retains exceptional research potential. It has stratigraphic clarity and integrity, and has been protected from all impact but erosion.

STATE OR NATIONAL REGISTER ELIGIBILITY: Eligible for the NRHP

RECOMMENDATIONS: Data recovery has been completed on the area of immediate impact from the Army Corps of Engineers revetment project. Other areas of the site have not been fully investigated and retain significance. If any future impact to the remainder of the site is planned, data recovery is recommended.
